### Factoring Finite State Machines - Stanford University

Factoring Finite State Machines Factoring a state machine is the process of splitting the machine into two or more simpler machines Factoring can greatly simplify the design of a state machine by separating orthogonal aspects of the machine into separate FSMs where they can be handled independently The separate FSMs communicate via logic signals

### Lecture 10 (Wed 10/15/2008) The multicycle datapath

As mentioned last time, we could translate this state diagram into a state table, and then make a logic circuit or stick it into a ROM This works pretty well for our small example, but designing a finite-state machine for a larger instruction set is much harder — There could be many states in the machine For example, some MIPS
